Dynamic memory management

- To allocate memory on the heap use the ‘new’ operator
- To free the memory use delete

```
int *p= new int;
delete p;
```

Dangling pointers and memory leaks

- Dangling pointer: Pointer points to a memory location that no longer exists
- Memory leaks (tardy free):
  - Heap memory not deallocated before the end of program
  - Heap memory that can no longer be accessed

Dynamic memory pitfalls

- Does calling foo() result in a memory leak? A. Yes B. No

```
void foo(){
      int * p = new int;

}
```

Q: Which of the following functions returns a dangling pointer?

```
int* f1(int num){
     int *mem1 =new int[num];
     return(mem1);
}
```

```
int* f2(int num){
      int mem2[num];
      return(mem2);
}
```

A. f1

B. f2

C. Both

DYNAMIC MEMORY ALLOCATION LINKED LISTS

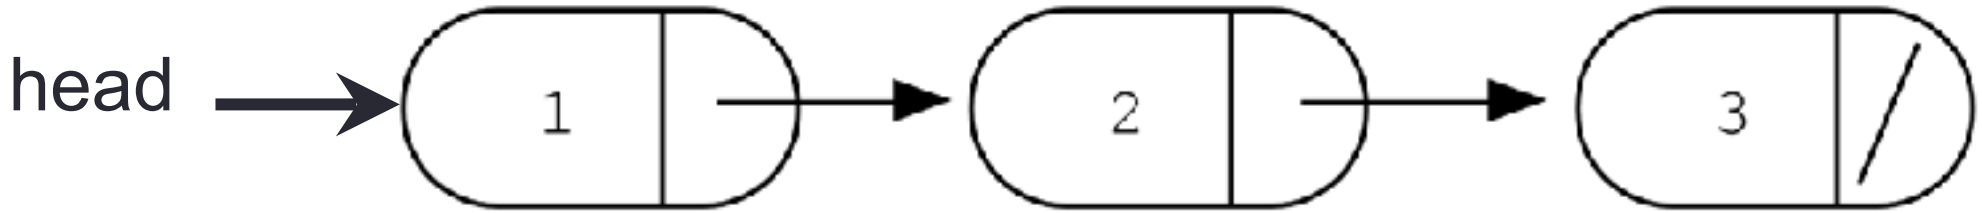
Linked List

Accessing elements of a list

```
struct Node {
        int data;
        Node *next;
};
```



Assume the linked list has already been created, what do the following expressions evaluate to?

1. head->data
2. head->next->data
3. head->next->next->data
4. head->next->next->next->data

A. 1
B. 2
C. 3
D. NULL
E. Run time error

Creating a small list

- Define an empty list
- Add a node to the list with data = 10

```
struct Node {
      int data;
      Node *next;
};
```

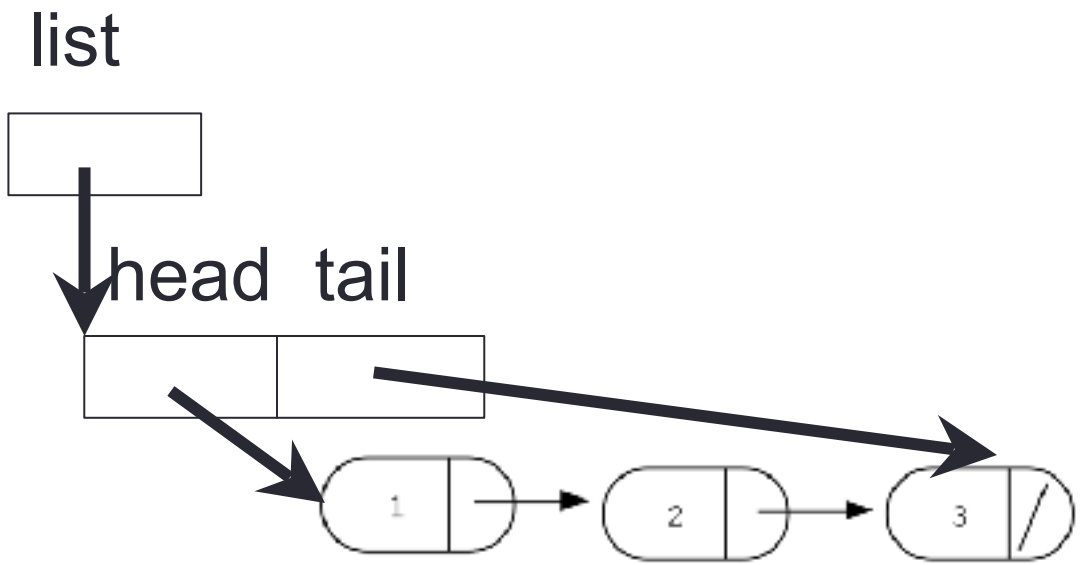
Inserting a node in a linked list

```
Void insertToHeadOfList(LinkedList* h, int value) ;
```

Iterating through the list

```
int lengthOfList(LinkedList * list) {
   /* Find the number of elements in the list */

}
```



Deleting the list

```
int freeLinkedList(LinkedList * list) {
   /* Free all the memory that was created on the heap*/
}
```
